

Survey on a Campus Borrowing and Exchange Website

Revised English Report

Source survey: 16 valid responses collected through an online questionnaire

Methodological note

A total of 16 valid responses were collected. One respondent did not report gender, so gender-based analyses in this report are based on the 15 respondents who provided gender information. The questionnaire showed relatively weak internal consistency (Cronbach's alpha = 0.482 for four items), so the results should be interpreted as exploratory findings rather than conclusive evidence.

Introduction

This report presents a revised English version of a classroom survey on a campus website for borrowing, exchanging, and sharing idle items. The survey explored students' experiences with borrowing and resource sharing in dormitory life, their need for an online platform, preferred resource types, concerns during exchanges, views on adding a buying-and-selling function, and their overall perception of the platform's usefulness. The findings are intended to provide practical reference for the design and improvement of a campus sharing platform.

Executive Summary

- Borrowing and resource sharing are often inconvenient in dormitory life. In this sample, 75.00% of respondents reported encountering such inconvenience.
- Demand for an online sharing platform was very strong: more than 90% of respondents said they needed one.
- Perceived demand for borrowing, exchanging, and sharing was evenly split between 'strong' and 'moderate' overall, but stronger among respondents who already wanted an online platform.
- Daily necessities were the most preferred category for sharing (37.50%), followed by study materials (31.25%) and tools (25.00%).
- Support for adding a buying-and-selling function was extremely high (93.75%).
- Item damage was the main concern during borrowing and exchange (56.25%), followed by loss (25.00%) and hygiene issues (18.75%).
- All respondents believed that such a platform would be helpful in daily life.

- Gender-based patterns appeared in several questions, but they should be interpreted cautiously because the gender subgroup analysis is based on only 15 respondents.

Overall Conclusion

Overall, the survey suggests that a campus borrowing and exchange platform addresses a real and visible need. Students not only reported inconvenience in everyday sharing situations, but also expressed strong support for an online platform that could help them find resources more efficiently. Daily necessities and study materials appear to be the most promising categories for early platform development, while trust and protection mechanisms will be important because damage to items was the most common concern. At the same time, the small sample size and the relatively low internal consistency of the questionnaire mean that the results should be treated as preliminary.

Recommendations

1. Focus the platform first on core functions such as clear item listings, fast search, basic matching, and simple communication between users.
2. Give priority to categories with the strongest demand, especially daily necessities, study materials, and tools.
3. Include a buying-and-selling function or reserve space for it, since support for this feature was very high in the survey.
4. Build user trust through practical safeguards such as condition descriptions, item photos, basic usage rules, and a simple feedback or rating mechanism.
5. Revise the questionnaire in future rounds by improving wording, strengthening item consistency, and collecting a larger sample.

Key Survey Results

Item	Result
Valid responses	16
Gender reported	15
Need for platform	>90%
Strong demand for sharing	50.00%
Top preferred category	Daily necessities (37.50%)
Support for buying/selling	93.75%
Main concern	Item damage (56.25%)
Perceived usefulness	100% positive responses

Detailed Findings

1. Reliability and Methodological Note

The questionnaire had a Cronbach's alpha of 0.482 across four items, which indicates relatively weak internal consistency. This does not make the survey unusable, but it does mean the findings should be interpreted with caution. In a small classroom project, the results can still be used as a preliminary reference, but future versions of the questionnaire should improve item design and coherence.

Because one respondent did not report gender, all gender comparisons in this report are based on 15 respondents rather than the full sample of 16. This adjustment has been made explicitly to keep the analysis internally consistent.

2. Inconvenience in Dormitory Borrowing and Resource Sharing

Among all 16 respondents, 75.00% said they often encountered inconvenience when borrowing, exchanging, or sharing resources in dormitory life, while 25.00% said they did not. This suggests that the issue is common enough to deserve attention.

Among the 15 respondents who reported gender, 87.50% of male respondents and 57.14% of female respondents reported such inconvenience. This pattern suggests that male respondents in this sample experienced the problem more frequently, although the difference should not be overstated given the small subgroup sizes.

3. Need for an Online Platform

More than 90% of respondents said they needed an online platform that could help them quickly find students willing to lend or share items. This indicates a broad base of interest in the proposed platform.

Among respondents who had previously experienced borrowing or sharing needs, all said they needed such a platform. Even among those without prior experience, most still supported the idea. This suggests that the platform could appeal both to users with immediate needs and to those with potential future needs.

Among the 15 respondents who reported gender, all male respondents and 85.71% of female respondents said they needed the platform. The overall pattern still points to strong demand across both groups.

4. Perceived Strength of Demand for Borrowing and Sharing

Across the full sample, 50.00% described the demand for borrowing, exchanging, and sharing as strong, while the other 50.00% described it as moderate. No respondent selected 'no demand.'

Among respondents who already wanted an online platform, 58.33% described the demand as strong, compared with 25.00% among those who did not want the platform. This suggests that support for the platform is associated with a stronger perception of need.

Among the 15 respondents who reported gender, 62.50% of male respondents and 28.57% of female respondents described the demand as strong. Female respondents more often selected the moderate option. This may reflect a difference in perceived urgency within this small sample.

5. Preferred Types of Shared Resources

Daily necessities were the most preferred category for sharing, selected by 37.50% of respondents. Study materials ranked second at 31.25%, and tools ranked third at 25.00%. Other categories such as snacks and electrical items attracted little or no interest.

Among respondents who described demand as strong, daily necessities and study materials were the two most favored categories. This suggests that these categories may be especially important to the platform's most interested users.

Among the 15 respondents who reported gender, male and female respondents showed broadly similar preferences, with daily necessities and study materials appearing near the top for both groups. The pattern does not support a strong practical need for gender-specific resource categories at this stage.

6. Demand for a Buying-and-Selling Function

Support for adding a buying-and-selling function was extremely high: 93.75% of respondents said they wanted this feature. This suggests that students view the platform not only as a sharing tool, but also as a possible channel for low-cost campus transactions.

Support remained high across different demand levels and item preferences. Even respondents with only moderate sharing demand generally supported adding this function.

Among the 15 respondents who reported gender, support was high in both groups, reaching 87.50% among male respondents and 100.00% among female respondents.

7. Main Concerns During Borrowing and Exchange

Item damage was the most common concern, selected by 56.25% of respondents. Loss ranked second at 25.00%, and hygiene issues ranked third at 18.75%. This suggests that trust and protection mechanisms would be essential to user participation.

Respondents with both strong and moderate demand identified damage as their main concern, so this issue does not appear to be limited to one subgroup.

Across resource categories, damage remained the leading concern. Among the 15 respondents who reported gender, female respondents were more likely than male respondents to select damage as their primary concern.

8. Perceived Usefulness of the Platform

All respondents said that the website or platform would be helpful in daily life. This indicates a highly positive general attitude toward the idea.

However, because all responses were positive, this item provides less differentiation than the others. It is most useful as evidence of broad approval rather than as a basis for more detailed comparison.

9. Gender Distribution

Of the 15 respondents who reported gender, 8 were male and 7 were female. This corresponds to 53.33% male and 46.67% female. The gender distribution in the reported subgroup was therefore relatively balanced.

Because one respondent did not report gender, these percentages should not be applied to the full sample of 16 without clarification.

10. Limitations

This was a small classroom survey with only 16 valid responses, so the findings cannot be generalized to the entire campus population.

Some subgroup percentages are sensitive to single responses because the subgroup sizes are small.

The questionnaire's internal consistency was relatively weak, which means the survey instrument itself would benefit from revision in future work.
